Propagation Watch

The propagation gods must have read the propagation report in Issue 559, because the sun immediately threw a curve toward DXers. As expected, solar activity increased to mid-month, with flux edging up to 220. Unfortunately, this increase in solar activity was accompanied with some solar flares, which disrupted the geomagnetic field.

After a week of superb band conditions at the end of September and early October, this increase in geomagnetic field slammed the door on the bands, at least temporarily. In particular, the low bands, which had been very good the previous week, were plagued by high absorption and poor signal-to-noise ratios. The polar path and long path were also adversely affected by the solar flares.

The good news is that the quieter side of the sun is rotating in our direction, and we should see a more stable geomagnetic field over the next two weeks.

The out-on-a-limb forecast for CQWW SSB Oct. 27-28 is excellent. Solar flux should be high enough to keep 10 meters open most daylight hours. Expected low A and K indices mean good polar and long paths, and above average conditions on the lower bands. With everyone going everywhere this contest (see summary on right), even contest haters should plan on spending some time on the air, picking up new countries and band-countries. Since Sunspot Cycle 22 has peaked, band conditions for CQWW probably won't be this good again for eight years or more. Don't miss this opportunity!
